Field of the Invention

10 The present invention relates to aryloxy piperidines, their synthesis and their use, for example, for the treatment of disorders and conditions mediated by the histamine receptor.

Background of the Invention

15 Histamine [2-(imidazol-4-yl)ethylamine] is a transmitter substance. Histamine exerts a physiological effect via multiple distinct G-protein coupled receptors. It plays a role in immediate hypersensitivity reactions and is released from mast cells following antigen IgE antibody interaction. The actions of released histamine on the vasculature and smooth muscle system account for the symptoms of the allergic response. These actions occur at the H₁ receptor (Ash, A.S.F. and Schild, H.O., *Br. J. Pharmacol.*, 1966, 27, 427) and are blocked by the classical antihistamines (e.g. diphenhydramine). Histamine is also an important regulator of gastric acid secretion through its action on parietal cells. These effects of histamine are mediated via the H₂ receptor (Black, J.W., Duncan, W.A.M., Durant, C.J., Ganellin, C.R. and Parsons, 20 E. M., *Nature*, 1972, 236, 385) and are blocked by H₂ receptor antagonists (e.g. cimetidine). The third histamine receptor —H₃— was first described as a presynaptic autoreceptor in the central nervous system (CNS) (Arrang, J.-M., Garbarg, M., and Schwartz, J.-C., *Nature* 1983, 302, 832) controlling the synthesis and release of histamine. Recent evidence has emerged showing that the H₃ 25 receptors are also located presynaptically as heteroreceptors on serotonergic, noradrenergic, dopaminergic, cholinergic, and GABAergic (gamma-aminobutyric acid containing) neurons. These H₃ receptors have also recently been identified in peripheral tissues such as vascular smooth muscle. Consequently there are many 30

- 5 potential therapeutic applications for histamine H_3 agonists, antagonists, and inverse agonists. (See: "The Histamine H_3 Receptor-A Target for New Drugs", Leurs, R., and Timmerman, H., (Editors), Elsevier, 1998; Morisset et al., *Nature*, 2000, **408**, 860-864.) A fourth histamine receptor — H_4 — was recently described by Oda et al., (*J. Biol. Chem.*, 2000, **275**, 36781-36786).

10

The potential use of histamine H_3 agonists in sleep/wake and arousal/vigilance disorders is suggested based on animal studies (Lin et al, *Br. Res.*, 1990, 523, 325; Monti et al *Eur. J. Pharmacol.*, 1991, 205, 283). Their use in the treatment of migraine has also been suggested (McLeod et al *Abstr. Society Neuroscience*, 1996, 22, 2010) based on their ability to inhibit neurogenic inflammation. Other applications could be a protective role in myocardial ischemia and hypertension where blockade of norepinephrine release is beneficial (Imamura et al *J. Pharmacol. Expt. Ther.*, 1994, 271, 1259). It has been suggested that histamine H_3 agonists may be beneficial in asthma due to their ability to reduce non-adrenergic non-cholinergic (NANC) neurotransmission in airways and to reduce microvascular leakage (Ichinose et al *Eur. J. Pharmacol.*, 1989, 174, 49).

Several indications for histamine H_3 antagonists and inverse agonists have similarly been proposed based on animal pharmacology experiments with known histamine H_3 antagonists (e.g. thioperamide). These include dementia, Alzheimer's disease (Panula et al *Abstr. Society Neuroscience*, 1995, 21, 1977), epilepsy (Yokoyama et al *Eur. J. Pharmacol.*, 1993, 234, 129) narcolepsy, eating disorders (Machidori et al *Brain Research* 1992, 590, 180), motion sickness, vertigo, attention deficit hyperactivity disorders (ADHD), learning and memory (Barnes et al *Abstr. Society Neuroscience*, 1993, 19, 1813), schizophrenia (Schlicker et al *Naunyn-Schmiedeberg's Arch. Pharmacol.*, 1996, 353, 290-294); (also see; Stark et al *Drugs Future*, 1996, 21, 507 and Leurs et al *Progress in Drug Research*, 1995, 45, 107 and references cited therein). Histamine H_3 antagonists, alone or in

5 combination with a histamine H₁ antagonist, are reported to be useful for the treatment of upper airway allergic response (U.S. Patent Nos. 5,217,986; 5,352,707 and 5,869,479). Recently, a histamine H₃ antagonist (GT-2331) was identified and is being developed by Gliatech Inc. (Gliatech Inc. Press Release Nov. 5, 1998; *Bioworld Today*, March 2, 1999) for the treatment of CNS disorders.

10

As noted, the prior art related to histamine H₃ ligands has been comprehensively reviewed ("*The Histamine H₃ Receptor-A Target for New Drugs*", Leurs, R., and Timmerman, H., (Editors), Elsevier, 1998). Within this reference the medicinal chemistry of histamine H₃ agonists and antagonists was reviewed (see 15 Krause et al and Phillips et al respectively). The importance of an imidazole moiety containing only a single substitution in the 4 position was noted together with the deleterious effects of additional substitution on activity. Particularly methylation of the imidazole ring at any of the remaining unsubstituted positions was reported to strongly decrease activity. Additional publications support the hypothesis that an 20 imidazole function is essential for high affinity histamine H₃ receptor ligands (See, Ali et al *J. Med. Chem.*, 1999, 42, 903 and Stark et al, *Drugs Future*, 1996, 21, 507 and references cited therein). However many imidazole containing compounds are substrates for histamine methyl transferase, the major histamine metabolizing enzyme in humans, which leads to shortened half lives and lower bioavailability 25 (See, Rouleau et al *J. Pharmacol. Exp. Ther.* 1997, 281, 1085). In addition, imidazole containing drugs, via their interaction with the cytochrome P450 monooxygenase system, can result in unfavorable biotransformations due to enzyme induction or enzyme inhibition. (Kapetanovic et al *Drug Metab. Dispos.* 1984, 12, 560; Sheets et al *Drug Metab. Dispos.* 1984, 12, 603; Back, et al *Br. J. 30 Pharmacol.* 1985, 85, 121; Lavrijsen et al *Biochem. Pharmacol.* 1986, 35, 1867; *Drug Saf.*, 1998, 18, 83). The poor blood brain barrier penetration of earlier histamine H₃ receptor ligands may also be associated with the imidazole fragment (Ganellin et al *Arch. Pharm. (Weinheim, Ger.)* 1998, 331, 395).

5

More recently, several publications have described histamine H₃ ligands that do not contain an imidazole moiety. For example; Ganellin et al *Arch. Pharm. (Weinheim, Ger.)* 1998, 331, 395; Walczynski et al *Arch. Pharm. (Weinheim, Ger.)* 1999, 332, 389; Walczynski et al *Farmaco* 1999, 684; Linney et al *J. Med. Chem.* 2000, 2362; Tozer and Kalindjian *Exp. Opin. Ther. Patents* 2000, 10, 1045-1055; U.S. Patent 5,352,707; PCT Application WO99/42458, Aug 26, 1999; and European Patent Application 0978512, Feb 9, 2000.

The compounds of the present invention do not contain the imidazole moiety, and its inherent liabilities, and maintain potency at the human H₃ receptor. Thus in the present invention receptor binding was determined using the human histamine H₃ receptor (See Lovenberg et al *Mol. Pharmacol.* 1999, 1107). Screening using the human receptor is particularly important for the identification of new therapies for the treatment of human disease. Conventional binding assays for example are determined using rat synaptosomes (Garbarg et al *J. Pharmacol. Exp. Ther.* 1992, 263, 304), rat cortical membranes (West et al *Mol. Pharmacol.* 1990, 610), and guinea pig brain (Korte et al *Biochem. Biophys. Res. Commun.* 1990, 978). Only limited studies have been performed previously using human tissue but these allude to significant differences in the pharmacology of rodent and primate receptors (West et al *Eur. J. Pharmacol.* 1999, 233).

We now describe a series of aryloxy piperidines with the ability to modulate the activity of the histamine receptor, specifically the H₃ receptor, without the inherent problems associated with the presence of an imidazolyl moiety.

A person of ordinary skill will be aware of variations and adaptations of the schemes and examples provided to achieve the compounds of the invention.

Throughout the schemes when the reacting functionality is located at R₃, one skilled in the art will recognize that the choice of R₃ is illustrative only and that the reacting functionality could also be located at R₁ and R₂ also.

Compounds of formula (I) may be prepared according to the processes outlined in Scheme 1.

Scheme 1

5

10 A compound of formula (I) is prepared as outlined in Scheme 1 by reacting a compound of formula (II) or a compound of formula (III) with a compound of formula (IV). A compound of formula (II) is reacted with a compound of formula (IV) in the presence of a base such as Cs_2CO_3 , K_2CO_3 , Na_2CO_3 , NaOH , KOH , LDA , LHMDS , or the like, in a solvent, for example DMF, DMA, THF, DME, DCM, and DMSO at a temperature from ambient to about 200 °C. In a preferred embodiment the base is selected from Cs_2CO_3 , K_2CO_3 , and Na_2CO_3 in a solvent selected from DMF, DMA. In a particularly preferred embodiment the base is Cs_2CO_3 and the solvent DMF at a temperature from 80 to 150 °C. One skilled in the art will recognize that the compound of formula (II) should contain both an X_1 substituent which is a leaving group, and a R_1 or R_3 group which is electron-withdrawing in order that the reaction with a compound of formula (IV) proceed. Preferred R_1 and R_3 substituents include - NO_2 , -CHO, -CN, CO_2R_{15} , COR_{16} , - $\text{CONR}_{17}\text{R}_{18}$, or the like. Preferred X_1 substituents include -F and -Cl, and -Br. Particularly preferred R_1 or R_3 substituents include - NO_2 , -CHO, -CN, and COR_{16} . Particularly preferred X_1 substituents include -F and -Cl. A compound of formula (I) may be prepared by reacting a compound of formula (III) with a compound of formula (IV) according to the Mitsunobu procedure (in the presence of triphenylphosphine or polymer supported triphenyl phosphine and DBAD or DEAD, in an organic solvent such as DCM, THF, and the like), to yield the corresponding compound of formula (I).

25

A compound of formula (VI) is prepared from a compound of formula (V) as outlined in Scheme 2.

5 **Scheme 2**

A compound of formula (VI) is prepared by reacting a compound of formula (V) with a compound of formula (II), or a compound of formula (III) according to the procedures of Step A and Step B of Scheme 1, respectively. The group Y_1 represents a protecting group. One skilled in the art will select the appropriate protecting group compatible with the desired reactions. Examples of preferred protecting groups include; carbamates, benzyl and substituted benzyl groups. Especially preferred protecting groups are; tert-butyloxycarbonyl, 2,2,2-trichloroethoxycarbonyl, alpha-chloroethoxycarbonyl, benzyl, 4-nitrobenzyl and diphenylmethyl.

One skilled in the art will recognize that addition of acid to decrease the pH of the reaction mixture to a pH of less than about 7 may be necessary to effect reaction, wherein the acid is added as needed and is such as acetic acid, hydrochloric acid, and the like. Preferred reducing agents are sodium cyanoborohydride or sodium triacetoxyborohydride. A compound of formula (IX) is prepared from a compound of formula (VIII) in Step C by reacting a compound of

One skilled in the art will recognize that addition of acid to decrease the pH of the reaction mixture to a pH of less than about 7 may be
25 necessary to effect reaction, wherein the acid is added as needed and is such as acetic acid, hydrochloric acid, and the like. One skilled in the art will furthermore recognize that a substituted or unsubstituted nonaromatic heterocycle containing secondary amine functionality may be used in place of the compound of formula (X). Preferred reducing agents are sodium cyanoborohydride or sodium

In a more preferred embodiment the catalyst is selected from; $Pd_2(dba)_3$, $PdCl_2$ and $Pd(OAc)_2$ with or without a phosphine additive. Preferred additives are triphenylphosphine and tri-(tert-butyl)phosphine. When the compound of formula (XXII) contains a triple bond (that is, when XXII is a terminal acetylene) an additional copper catalyst may be desirable. A preferred catalyst is a Cu(I) halide with CuI being especially preferred. A further preferred embodiment includes catalysts, together with a base selected from an amine, Na_2CO_3 , K_2CO_3 , or the like. A particularly preferred base is aqueous K_2CO_3 . These reactions are carried out in a solvent selected from, THF, DMF, DME, DMA, benzene, toluene, DCM, or the like.

Scheme 6

- 20 A compound of formula (XXIV), where Y_1 represents an oxygen protecting group, is reacted with a compound of formula (XXVII), where $Z_2\text{H}$ represents a heterocycle in which a nitrogen-hydrogen bond is present, to give a compound of

- 5 formula (XXVI) where the group Z_2 is attached via a nitrogen atom. In a preferred embodiment a compound of formula (XXIV) is reacted with a compound of formula (XXVII) in the presence of $\text{Cu}(\text{OAc})_2$, in the presence of a base such as pyridine, a dehydrating agent such as molecular sieves 4A in DCM at ambient temperature to give a compound of formula (XXVI). In one embodiment Y_1 is a substituted benzyl ether, which may be removed upon treatment with hydrogen in the presence of palladium on carbon. A compound of formula (XXV) is obtained by reacting a compound of formula (XXVIII) with a compound of formula (IV) according to the procedures outlined in Step B of
- 15 Scheme 1.

A compound of formula (XXX) is obtained from a compound of formula (XXIX) as outlined in Scheme 7.

20

Scheme 7

5 A compound of formula (XXXI) is obtained from a compound of formula (XXIX) by reacting a compound of formula (XXIX) with a reducing agent in a solvent. Reducing agents include hydrogen gas over a catalyst, for example palladium, platinum, Raney nickel or the like. In a preferred embodiment the reducing agent is SnCl_2 in ethanol in the presence or absence of water at ambient temperature to the boiling point of the solvent. A compound of formula (XXXII) is prepared from a compound of formula (XXXI) by reacting a compound of formula (XXXI) with a compound of formula (XXXIII) in which X_2 is a leaving group. Thus when X_2 is Cl the compound of formula (XXXI) is reacted with a compound of formula (XXXIII) in a solvent such as DCM or THF in the presence of a base such as triethylamine or pyridine. When X_2 is OH a compound of formula (XXXI) is reacted with a compound of formula (XXXIII) via peptide coupling, for example in the presence of DCC in a solvent such as DCM or THF. A compound of formula (XXX) is prepared from a compound of formula (XXXII) using a reducing agent. Reducing agents include; $\text{BH}_3\cdot\text{THF}$, and $\text{BH}_3\cdot\text{Me}_2\text{S}$. A preferred reducing agent is $\text{BH}_3\cdot\text{Me}_2\text{S}$, in THF at elevated temperature, preferably at the boiling point of the solvent.

One skilled in the art will recognize that addition of acid to decrease the pH of the reaction mixture to a pH of less than about 7 may be necessary to effect reaction, wherein the acid is added as needed and is such as acetic acid, hydrochloric acid, and the like. One skilled in the art will furthermore recognize that a substituted or unsubstituted nonaromatic heterocycle containing secondary amine functionality may be used in place of the compound of formula (X). A compound of formula (XXXVI) is reacted with a compound of formula (IV) according to the procedure of Step B, Scheme 1, to give a compound of formula (XXXV).

 solvent such as methanol, ethanol, 1,2-dichloroethane, trifluoroethanol, and the like,
 to yield the compound of formula (XXXVII). One skilled in the art will recognize that
 addition of acid to decrease the pH of the reaction mixture to a pH of less than about

10

15 1. Formulation and Administration

20 The compounds or compositions of the invention may be formulated and administered to a subject by any conventional route of administration, including, but not limited to, intravenous, oral, subcutaneous, intramuscular, intradermal and parenteral administration. The quantity of the compound which is effective for treating each condition may vary, and can be determined by one of ordinary skill in the art.

25 For use in medicine, the salts of the compounds of this invention refer to non-toxic "pharmaceutically acceptable salts." Other salts may, however, be useful in the preparation of compounds according to this invention or of their pharmaceutically acceptable salts. Suitable pharmaceutically acceptable salts of the compounds include acid addition salts which may, for example, be formed by mixing a solution of
30 the compound with a solution of a pharmaceutically acceptable acid such as hydrochloric acid, sulfuric acid, fumaric acid, maleic acid, succinic acid, acetic acid, benzoic acid, citric acid, tartaric acid, carbonic acid or phosphoric acid. Furthermore, where the compounds of the invention carry an acidic moiety, suitable

- 5 pharmaceutically acceptable salts thereof may include alkali ml salts, e.g., sodium or potassium salts; alkaline earth ml salts, e.g., calcium or magnesium salts; and salts formed with suitable organic ligands, e.g., quaternary ammonium salts.

Thus, representative pharmaceutically acceptable salts include the following: acetate, benzenesulfonate, benzoate, bicarbonate, bisulfate, bitartrate, borate,

- 10 bromide, calcium edetate, camsylate, carbonate, chloride, clavulanate, citrate, dihydrochloride, edetate, edisylate, estolate, esylate, fumarate, gluceptate, gluconate, glutamate, glycolylarsanilate, hexylresorcinate, hydrabamine, hydrobromide, hydrochloride, hydroxynaphthoate, iodide, isothionate, lactate, lactobionate, laurate, malate, maleate, mandelate, mesylate, methylbromide, methylnitrate, methylsulfate, mucate, napsylate, nitrate, N-methylglucamine ammonium salt, oleate, pamoate (embonate), palmitate, pantothenate, phosphate/diphosphate, polygalacturonate, salicylate, stearate, sulfate, subacetate, succinate, tannate, tartrate, teoclate, tosylate, triethiodide and valerate.

20 The present invention includes within its scope prodrugs of the compounds of this invention. In general, such prodrugs will be functional derivatives of the compounds which are readily convertible *in vivo* into the required compound. Thus, in the methods of treatment of the present invention, the term "administering" shall encompass the treatment of the various disorders described with the compound specifically disclosed or with a compound which may not be specifically disclosed, but which converts to the specified compound *in vivo* after administration to the patient. Conventional procedures for the selection and preption of suitable prodrug derivatives are described, for example, in "Design of Prodrugs", ed. H. Bundgaard, Elsevier, 1985. In addition to salts, the invention provides the esters, amides, and other protected or derivatized forms of the described compounds.

Where the compounds according to this invention have at least one chiral center, they may accordingly exist as enantiomers. Where the compounds possess

5 two or more chiral centers, they may additionally exist as diastereomers. It is to be understood that all such isomers and mixtures thereof are encompassed within the scope of the present invention. Furthermore, some of the crystalline forms for the compounds may exist as polymorphs and as such are intended to be included in the present invention. In addition, some of the compounds may form solvates with
10 water (i.e., hydrates) or common organic solvents, and such solvates are also intended to be encompassed within the scope of this invention.

The present invention also provides pharmaceutical compositions comprising one or more compounds of this invention in association with a pharmaceutically
15 acceptable carrier and optionally additional pharmaceutical agents such as H₁ antagonists or SSRIs. Preferably these compositions are in unit dosage forms such as pills, tablets, caplets, capsules (each including immediate release, timed release and sustained release formulations), powders, granules, sterile parenteral solutions or suspensions (including syrups and emulsions), metered aerosol or liquid sprays,
20 drops, ampoules, autoinjector devices or suppositories; for oral parenteral, intranasal, sublingual or rectal administration, or for administration by inhalation or insufflation. Alternatively, the composition may be presented in a form suitable for once-weekly or once-monthly administration; for example, an insoluble salt of the active compound, such as the decanoate salt, may be adapted to provide a depot
25 preparation for intramuscular injection. For preparing solid compositions such as tablets, the principal active ingredient is mixed with a pharmaceutical carrier, e.g. conventional tableting ingredients such as corn starch, lactose, sucrose, sorbitol, talc, stearic acid, magnesium stearate, dicalcium phosphate or gums, and other pharmaceutical diluents, e.g. water, to form a solid preformulation composition
30 containing a homogeneous mixture of a compound of the present invention, or a pharmaceutically acceptable salt thereof. When referring to these preformulation compositions as homogeneous, it is meant that the active ingredient is dispersed evenly throughout the composition so that the composition may be readily

5 subdivided into equally effective dosage forms such as tablets, pills and capsules. This solid preformulation composition is then subdivided into unit dosage forms of the type described above containing from 5 to about 1000 mg of the active ingredient of the present invention. Examples include 5 mg, 7 mg, 10 mg, 15 mg, 20 mg, 35 mg, 50 mg, 75 mg, 100 mg, 120 mg, 150 mg, and so on. The tablets or pills
10 of the disclosed compositions can be coated or otherwise compounded to provide a dosage form affording the advantage of prolonged action. For example, the tablet or pill can comprise an inner dosage and an outer dosage component, the latter being in the form of an envelope over the former. The two components can be septed by an enteric layer which serves to resist disintegration in the stomach and permits the
15 inner component to pass intact into the duodenum or to be delayed in release. A variety of material can be used for such enteric layers or coatings, such materials including a number of polymeric acids with such materials as shellac, cetyl alcohol and cellulose acetate.

20 The liquid forms in which the compounds and compositions of the present invention may be incorporated for administration orally or by injection include, aqueous solutions, suitably flavoured syrups, aqueous or oil suspensions, and flavoured emulsions with edible oils such as cottonseed oil, sesame oil, coconut oil or peanut oil, as well as elixirs and similar pharmaceutical vehicles. Suitable
25 dispersing or suspending agents for aqueous suspensions, include synthetic and natural gums such as tragacanth, acacia, alginate, dextran, sodium carboxymethylcellulose, methylcellulose, polyvinyl-pyrrolidone or gelatin.

30 Where the processes for the preparation of the compounds according to the invention give rise to mixture of stereoisomers, these isomers may be separated by conventional techniques such as preparative chromatography. The compounds may be prepared in racemic form, or individual enantiomers may be prepared either by enantiospecific synthesis or by resolution. The compounds may, for example, be

- 5 resolved into their component enantiomers by standard techniques, such as the formation of diastereomeric pairs by salt formation with an optically active acid, such as (-)-di-p-toluoyl-d-tartaric acid and/or (+)-di-p-toluoyl-l-tartaric acid followed by fractional crystallization and regeneration of the free base. The compounds may also be resolved by formation of diastereomeric esters or amides, followed by
- 10 chromatographic separation and removal of the chiral auxiliary. Alternatively, the compounds may be resolved using a chiral HPLC column.

Advantageously, compounds of the present invention may be administered in a single daily dose, or the total daily dosage may be administered in divided doses of two, three or four times daily. Furthermore, compounds for the present invention can be administered in intranasal form via topical use of suitable intranasal vehicles, or via transdermal skin patches well known to those of ordinary skill in that art. To be administered in the form of a transdermal delivery system, the dosage administration will, of course, be continuous rather than intermittent throughout the dosage regimen.

For instance, for oral administration in the form of a tablet or capsule, the active drug component can be combined with an oral, non-toxic pharmaceutically acceptable inert carrier such as ethanol, glycerol, water and the like. Moreover, when desired or necessary, suitable binders, lubricants, disintegrating agents and coloring agents can also be incorporated into the mixture. Suitable binders include, without limitation, starch, gelatin, natural sugars such as glucose or beta-lactose, corn sweeteners, natural and synthetic gums such as acacia, tragacanth or sodium oleate, sodium stearate, magnesium stearate, sodium benzoate, sodium acetate, sodium chloride and the like. Disintegrators include, without limitation, starch, methyl cellulose, agar, bentonite, xanthan gum and the like.

The compound of the present invention can also be administered in the form of liposome delivery systems, such as small unilamellar vesicles, large unilamellar

- 5 vesicles, and multilamellar vesicles. Liposomes can be formed from a variety of phospholipids, such as cholesterol, stearylamine or phosphatidylcholines.

10 Compounds of the present invention may also be delivered by the use of monoclonal antibodies as individual carriers to which the compound molecules are coupled. The compounds of the present invention may also be coupled with soluble polymers as targetable drug carriers. Such polymers can include polyvinylpyrrolidone, pyran copolymer, polyhydroxypropylmethacrylamidephenol, polyhydroxyethylaspartamidephenol, or polyethyleneoxidepolylysine substituted with palmitoyl residue. Furthermore, the compounds of the present invention may be coupled to a class of biodegradable polymers useful in achieving controlled release of a drug, for example, polylactic acid, polyepsilon caprolactone, polyhydroxy butyric acid, polyesters, polyacetals, polydihydropyrans, polycyanoacrylates and cross-linked or amphipathic block copolymers of hydrogels.

20 Compounds of this invention may be administered in any of the foregoing compositions and according to dosage regimens established in the art whenever treatment of ADHD is required.

25 The daily dosage of the products may be varied over a wide range from 1 to 1,000 mg per adult human per day. For oral administration, the compositions are preferably provided in the form of tablets containing 1.0, 5.0, 10.0, 15.0, 25.0, 50.0, 100, 250 and 500 milligrams of the active ingredient for the symptomatic adjustment of the dosage to the subject to be treated. An effective amount of the drug is ordinarily supplied at a dosage level of from about 0.01 mg/kg to about 20 mg/kg of body weight per day. Preferably, the range is from about 0.02 mg/kg to about 10 mg/kg of body weight per day, and especially from about 0.05 mg/kg to about 10 mg/kg of body weight per day. The compounds may be administered on a regimen of 1 to 4 times per day.

5

Optimal dosages to be administered may be readily determined by those skilled in the art, and will vary with the particular compound used, the mode of administration, the strength of the preparation, the mode of administration, and the advancement of the disease condition. In addition, factors associated with the particular patient being treated, including patient age, weight, diet and time of administration, will result in the need to adjust dosages.

2. Combination Therapy

The disclosed compounds are useful in combination with other therapeutic agents, including H₁ receptor antagonists, H₂ receptor antagonists, and neurotransmitter modulators such as SSRIs and non-selective serotonin re-uptake inhibitors (NSSRIs).

Methods are known in the art for determining effective doses for therapeutic and prophylactic purposes for the disclosed pharmaceutical compositions or the disclosed drug combinations, whether or not formulated in the same composition. For therapeutic purposes, the term "jointly effective amount" as used herein, means that amount of each active compound or pharmaceutical agent, alone or in combination, that elicits the biological or medicinal response in a tissue system, animal or human that is being sought by a researcher, veterinarian, medical doctor or other clinician, which includes alleviation of the symptoms of the disease or disorder being treated. For prophylactic purposes (i.e., inhibiting the onset or progression of a disorder), the term "jointly effective amount" refers to that amount of each active compound or pharmaceutical agent, alone or in combination, that inhibits in a subject the onset or progression of a disorder as being sought by a researcher, veterinarian, medical doctor or other clinician, the delaying of which disorder is mediated, at least in part, by the modulation of one or more histamine receptors. Thus, the present invention provides combinations of two or more drugs wherein, for example, (a) each drug is administered in an independently

- 5 therapeutically or prophylactically effective amount; (b) at least one drug in the combination is administered in an amount that is sub-therapeutic or sub-prophylactic if administered alone, but is therapeutic or prophylactic when administered in combination with the second or additional drugs according to the invention; or
- 10 (c) both drugs are administered in an amount that is sub-therapeutic or sub-prophylactic if administered alone, but are therapeutic or prophylactic when administered together. Combinations of three or more drugs are analogously possible. Methods of combination therapy include co-administration of a single formulation containing all active agents; essentially contemporaneous administration of more than one formulation; and administration of two or more active agents
- 15 separately formulated.

BIOLOGICAL METHODS

In Vitro

Transfection of cells with human histamine receptor

10 A 10 cm tissue culture dish with a confluent monolayer of SK-N-MC cells was split two days prior to transfection. Using sterile technique the media was removed and the cells were detached from the dish by the addition of trypsin. One fifth of the cells were then placed onto a new 10 cm dish. Cells were grown in a 37°C incubator with 5% CO₂ in Minimal Essential Media Eagle with 10% Fetal Bovine Serum. After two days cells were approximately 80% confluent. These were removed from the dish with trypsin and pelleted in a clinical centrifuge. The pellet was then re-suspended in 400 µL complete media and transferred to an electroporation cuvette with a 0.4 cm gap between the electrodes (Bio-Rad #165-2088). One microgram of supercoiled H₃ receptor cDNA was added to the cells and mixed. The voltage for the electroporation was set at 0.25 kV, the capacitance was set at 960 µF. After electroporation the cells were diluted into 10 mL complete media and plated onto four 10 cm dishes. Because of the variability in the efficiency of electroporation, four different concentrations of cells were plated. The ratios used were; 1:20, 1:10, 1:5, with the remainder of the cells being added to the fourth dish.

25 The cells were allowed to recover for 24 hours before adding the selection media (complete media with 600 µg/mL G418). After 10 days dishes were analyzed for surviving colonies of cells. Dishes with well isolated colonies were used. Cells from individual colonies were isolated and tested. SK-N-MC cells were used because they give efficient coupling for inhibition of adenylate cyclase. The clones that gave the

30 most robust inhibition of adenylate cyclase in response to histamine were used for further study.

5 $[^3\text{H}]$ -N-methylhistamine binding

Cell pellets from histamine H_3 receptor-expressing SK-N-MC cells were homogenized in 20 mM TrisHCl/0.5 mM EDTA. Supernatants from a 800 g spin were collected, recentrifuged at 30,000 g for 30 minutes. Pellets were re-homogenized in 50 mM Tris/5 mM EDTA (pH 7.4). Membranes were incubated with 10 0.8 nM $[^3\text{H}]$ -N-methylhistamine plus/minus test compounds for 45 min at 25°C and harvested by rapid filtration over GF/C glass fiber filters (pretreated with 0.3 % polyethylenimine) followed by four washes with ice cold buffer. Filters were dried, added to 4 mL scintillation cocktail and then counted on a liquid scintillation counter. Non-specific binding was defined with 10 μM histamine. The pK_i values were calculated based on a K_d of 800 pM and a ligand concentration ($[\text{L}]$) of 800 pM according to the formula:

$$K_i = (\text{IC}_{50}) / (1 + ([\text{L}] / (K_d)))$$

In Vivo

Elucidation of oral absorption and blood-brain barrier penetration profiles of H_3 receptor antagonists in the rat

25 A rat *in vivo* system was used to determine the blood-brain barrier penetration profiles and kinetics of various H_3 receptor antagonists after single bolus oral administration.

Female Sprague Dawley Rats (~300 gram body weight) were housed in accordance with institutional standards and allowed to acclimate for at least 7 days prior to the study. Each H_3 antagonist was formulated in 0.5% hydroxypropylmethyl 30 cellulose at a concentration of 1 mg/mL for oral dosing. The test compound was administered to each of eight animals as a single oral dose of 10 mL/kg (10 mg/kg). Remaining dosing solution was retained for analysis. Two animals from each original group of eight were euthanized via CO_2 asphyxiation at $t = 1, 6, 24$, and 48

5 hours. After each animal was euthanized, 0.1 mL of its blood was sampled via cardiac puncture, and its brain was removed via dissection of the cranial bones and placed in a pre-weighed 50 mL conical tube on dry ice.

10 The blood was added to 0.3 mL of 6% trichloroacetic acid, and the acidified sample was vortexed and then centrifuged (5 minutes at 14,000 rpm in a microcentrifuge). The clear supernatant was retained for analysis. The frozen brain was weighed, homogenized in 6% trichloroacetic acid (3 mL/g wet weight of tissue), and then centrifuged. The clear supernatant was retained for analysis. The supernatants from the blood and brain samples were analyzed by liquid chromatography with mass spectral detection utilizing selective reaction monitoring (LC-MS/MS). The LC method used a Phenomenex Polar RP column (2 x 50 mm) and a linear solvent gradient of water and acetonitrile (both 1% in acetic acid).

20 Graphs of H₃ receptor antagonist concentration versus time for blood and brain were generated from the LC-MS/MS results. The mean residency time (MRT) of the H₃ receptor antagonist, in blood or in the brain, was calculated from the ratio of the area under the first moment curve (AUMC) to the area under the concentration time curve (AUC): AUMC/AUC. The Blood Brain Barrier index was calculated from the log of $AUC_{\text{brain}}/AUC_{\text{blood}}$.
